

Calculator

Instructions

- Using the Spreadsheet and Unsolved VBS code as a starter, complete the script such that `Price`, `Tax`, `Quantity`, and `Total` are stored in variables.
- These variables should be then assigned the value of the cell they are associated with in the spreadsheet.
- When finished, your code should set the `Total` value in the spreadsheet and print a message box with the total in the form of: "Your total is \$45.00"

Bonus

- Try to complete the exercise, *without* looking at the starter code.
