# Hello Variable World

## Instructions

- Create two variables called `name` and `country` that will hold strings.

- Create two variables called `age` and `hourly_wage` that will hold integers.

- Create a variable called `satisfied` which will hold a boolean.

- Create a variable called `daily_wage` that will hold the value of `hourly_wage` multiplied by 8.

- Use traditional string concatenation to print the `name`, `country`, `age`, and `hourly_wage` variables.

- With an `f-string`, print the `daily_wage` and `satisfied` variables.

## Hint

- For additional help with f-strings, visit Python 3's f-Strings.
